

THE IMPORTANCE OF SAFETY OF LIFE ACTIVITIES DURING THE CORONAVIRUS PANDEMY

Abdulleva Arofatxon Abduvahobovna

Intern at Andijan State University

Annotation.

Life safety in all spheres of our society is aimed at protecting human life, creating safe living and working conditions for him, protecting his health from the effects of dangerous factors. Because the activities in a safe environment is the legitimate rights and freedoms of citizens. The relay-vance of the article lies in the fact that in order to focus on the important aspects of gaining knowledge about safety while protecting human life and health in the context of the pandemic coronavirus.

Key words:

Risk, safety, biological risk, coronavirus pandemic, atypical pneumonia, immunity, pan-demic, cause-risk-effect, quarantine.

Human life and health are above all. That is why the protection of human health and its safety is a priority of every state. Because a healthy nation, a healthy people is the priceless wealth of the state. As you know, the issue of the protection of the dangers of man on earth distant ancestors appear to be bi LAN at the same time. This problem is still acute in the face of humanity to this day, and day by day the issue of security requires even more attention. If in the early days of mankind man was threatened mainly by natural hazards, then, over time, man began to create new sources of danger with his own hands. These sources of danger began to threaten not only man but also society and the state. As a result, ensuring the safety of vital activities remains one of the main goals facing the individual, society and the state.

Living in peace and tranquility is the incomparable happiness of everyone. In order to preserve peace and tranquility and pass it on to the next generation, every citizen must fight in his or her active direction. Therefore, security should be the goal of each of us. In order to ensure safety, it serves as a guide, a tool to guide the safety of life activities.

The purpose of life safety is to protect human life in all spheres of our society, to create safe working conditions for him, to protect his health from dangerous production and the harmful effects of the natural environment.

The most pressing topic today is the biological threat that threatens the whole world, the pandemic of the Coronavirus. Originally from Wuhan, China, it was a disease that caused the whole world to die. The disease, like many other countries, has not gone unnoticed in Uzbekistan, and in our country there is a courageous struggle with an invisible enemy in order to protect the health of the population and ensure a safe life.

The reforms carried out by our President have been rightly accepted by our people, and the results are being reflected in our lives.

What is the danger of coronavirus?

- ♦ The virus is new.
- ♦ No one on earth is immune to this disease.
- ♦ This disease can affect anyone.
- ♦ The virus has been shown to be transmitted from person to person.

- ◆ There are deaths from the disease.
- ◆ Vaccine against the virus is not yet ready.

Coronavirus is a virus that belongs to the family of viruses called "Atypical zotiljam" (SARS), which causes a disease called acute respiratory syndrome, which can range from mild to severe. The virus was named " COVID-2019" as a result of research .

Today, young and old have their own understanding and worldview about this disease. Because coronavirus disease has shown and continues to show a certain degree of impact on everyone's normal life activities. So how do we see the negative impact of the Coronavirus pandemic on life safety, in turn, the impact of life safety on the coronavirus?

The central concept of life safety is risk. Danger poses an urgent threat to human life, health and safety, whether it is the living environment or the production environment. Therefore , the safety of life on their own Codes in order to provide security in a variety of environmental conditions.

Today, the Coronavirus pandemic has entered the study of life safety , as in all areas . A pandemic is a massive outbreak of a contagious disease that affects people all over the world, a dangerous natural phenomenon that affects the health of people, disrupts their health, and even causes death.

The methodological basis of life safety is a systematic analysis, that is, a systematic analysis of the object of study in two different ways: *cause - risk - consequence* or, conversely, *consequence - risk - cause* .

The first method is the most effective way to prevent side effects . For example, in order to avoid getting coronavirus, we are required to wear a mask, not to shake hands, to wash our hands frequently with soap, to keep a distance, not to gather in public places, etc., which is the reason for contracting coronavirus. serves. The spread of the virus in the body poses a threat to our health , which, in turn, can lead to unintended consequences, such as baldness and even death . Thus, the unpleasant consequences that may occur in the reasons for knowing the rules, procedures green ash and operates Bo radio, there is no threat today will make our lives threatened.

October 15, 2008 was officially declared Handwashing Day by the United Nations General Assembly, UNICEF and WHO. " *October 15 - World Handwashing Day* ". Why? This is because it is precisely on this day that unwashed hands have been found to cause the spread and death of many infectious diseases, as well as to organize and influence countries that do not adhere to personal hygiene . An example of this is the need to wash hands and disinfect them with the necessary tools to prevent the spread of the disease in the current pandemic . For example, hand washing with soap reduces infant mortality from pneumonia and other respiratory diseases by up to 25%, and from diarrhea and other intestinal diseases by up to 50%.

In today's medicine, following proper hand hygiene is the easiest, cheapest, and most effective way to reduce the spread of infectious diseases.

The second method - after the unpleasant consequences, these consequences do you ravens risks, and the show is designed to be learn, depending on the conditions, which is why going to the nib. This method allows us to prepare in advance for similar events that may occur unexpectedly. From the outbreak of coronavirus to its spread all over the world and its arrival in our country, our state has done a lot of positive work to prevent the disease and ensure the safety of the population.

Following the discovery of the first case of coronavirus infection in Uzbekistan on March 15, the government immediately took drastic measures to prevent the spread of COVID-19 in the country .

First of all, the leadership of Prime Minister Abdullah Aripov refusal settings officials, self- rat anti-national commission was established. As part of quarantine measures, the Commission has introduced a strict quarantine regime in almost all regions of the country. In the first place, measures to protect the health of the population were aimed at preventing the spread of the virus among the population , and secondly, economic measures were aimed at supporting national production and entrepreneurship.

Quarantine is a set of anti-brain and anti- epidemic measures aimed at complete isolation and elimination of the source of infectious disease . Under quarantine conditions , the task of health stone kilos is to keep the infection out of the affected area and then completely eradicate it within the prescribed timeframes.

The pandemic conditions are inherently related to the safety rules of life activities, urging everyone to be vigilant. It should be noted that today in our country there are measures to support everyone from this disease - both physically, mentally and materially. The growing threat of a coronavirus pandemic in the world requires the improvement of approaches to combating infectious diseases, including coronavirus infection, as well as the institutional framework and organizational structure of the sanitary-epidemiological service based on current complex conditions and experience.

The financial resources allocated by the Government of Uzbekistan are used to strengthen the capacity of the health care system, personal protective equipment and other medical equipment. The moments of defeat of the invisible enemy are near. Uniting our people and our state, we will definitely get rid of this danger that threatens the whole world.

As the President noted, today's situation is a test for all of us. We are confident that we can overcome this test together. Life does not always go smoothly. In any case, only a clear goal, a bold step, will determine the future of our country.
